

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-12. (Canceled)

13. (Currently Amended) A method of providing an IP address for a host in a computer network, the method comprising the steps of:

receiving, from a client in a computer network, at an appliance a request for an IP address associated with a domain name ~~from a client in a computer network~~;

retrieving the requested IP address from an object oriented database associated with the appliance; and

transmitting the retrieved IP address to the client;

wherein retrieving includes:

accessing a first network object in the object oriented database, wherein the first network object is associated with a first IP sub-network;

identifying a second network object in the object oriented database, wherein the second network object is associated with a second IP sub-network and the second network object is linked to the first network object; and

obtaining the IP address based at least in part on the second network object.

~~wherein the appliance includes a processor configured to run an operating system that is optimized to provide a network name related functionality, including by omitting from the operating system kernel at least one operating system kernel component that is not required to provide the network name related functionality.~~

14. (Previously Presented) The method of claim 13, further comprising the step of establishing communicative coupling between a client web browser and the appliance.

15. (Original) The method of claim 13, wherein the computer network comprises the Internet.
16. (Original) The method of claim 13, wherein the computer network comprises an IP based computer network.
17. (Original) The method of claim 13, wherein the computer network comprises an intranet.
18. (Previously Presented) The method of claim 13, wherein the appliance receives the request.
19. (Previously Presented) The method of claim 13, further including linking a host object with a network object and a zone object.
20. (Previously Presented) The method of claim 19, wherein the zone object is linked to another zone object.
21. (Previously Presented) The method of claim 19, wherein the network object is linked to another network object.
22. (Previously Presented) The method of claim 13, further including:
 unlinking an old network object from a host object;
 deleting the old network object; and
 linking the host object to a new network object.
23. (Previously Presented) The method of claim 22, further including automatically updating the host object to reflect an association with the new network object.
- 24-35. (Canceled)
36. (Currently Amended) A computer program product for providing an IP address for a host in a computer network, the computer program product being embodied in a computer readable medium and comprising computer instructions for:
- receiving, from a client in a computer network, at an appliance a request for an IP address associated with a domain name ~~from a client in a computer network~~;
 retrieving the requested IP address from an object oriented database associated with the appliance; and

transmitting the retrieved IP address to the client;

wherein retrieving includes:

accessing a first network object in the object oriented database, wherein the first network object is associated with a first IP sub-network;

identifying a second network object in the object oriented database, wherein the second network object is associated with a second IP sub-network and the second network object is linked to the first network object; and

obtaining the IP address based at least in part on the second network object.

~~wherein the appliance includes a processor configured to run an operating system that is optimized to provide a network name related functionality, including by omitting from the operating system kernel at least one operating system kernel component that is not required to provide the network name related functionality.~~

37. (Previously Presented) A computer program product as recited in claim 36, the computer program product further comprising computer instructions for establishing communicative coupling between a client web browser and the appliance.

38. (Previously Presented) A computer program product as recited in claim 36, wherein the computer network comprises the Internet.

39. (Previously Presented) A computer program product as recited in claim 36, wherein the computer network comprises an IP based computer network.

40. (Previously Presented) A computer program product as recited in claim 36, wherein the computer network comprises an intranet.

41. (Previously Presented) A computer program product as recited in claim 36, wherein the appliance receives the request.

42. (Previously Presented) A computer program product as recited in claim 36, the computer

program product further comprising computer instructions for linking a host object with a network object and a zone object.

43. (Previously Presented) A computer program product as recited in claim 42, wherein the zone object is linked to another zone object.

44. (Previously Presented) A computer program product as recited in claim 42, wherein the network object is linked to another network object.

45. (Previously Presented) A computer program product as recited in claim 36, the computer program product further comprising computer instructions for:

unlinking an old network object from a host object;

deleting the old network object; and

linking the host object to a new network object.

46. (Previously Presented) A computer program product as recited in claim 45, the computer program product further comprising computer instructions for automatically updating the host object to reflect an association with the new network object.

47-58. (Canceled)

59. (Currently Amended) A system for providing an IP address for a host in a computer network, including:

a processor configured to:

receive, from a client in a computer network, at an appliance a request for an IP address associated with a domain name ~~from a client in a computer network~~;

retrieve the requested IP address from an object oriented database associated with the appliance;

transmit the retrieved IP address to the client;

wherein to retrieve includes:

accessing a first network object in the object oriented database, wherein the first network object is associated with a first IP sub-network;

identifying a second network object in the object oriented database, wherein the second network object is associated with a second IP sub-network and the second network object is linked to the first network object; and

obtaining the IP address based at least in part on the second network object.

~~run an operating system that is optimized to provide a network name-related functionality, including by omitting from the operating system kernel at least one operating system kernel component that is not required to provide the network name-related functionality.~~

and

a memory coupled with the processor, wherein the memory provides the processor with instructions.

60. (Previously Presented) The system of claim 59, wherein the processor is further configured to establish communicative coupling between a client web browser and the appliance.

61. (Previously Presented) The system of claim 59, wherein the computer network comprises the Internet.

62. (Previously Presented) The system of claim 59, wherein the computer network comprises an IP based computer network.

63. (Previously Presented) The system of claim 59, wherein the computer network comprises an intranet.

64. (Previously Presented) The system of claim 59, wherein the appliance receives the request.

65. (Previously Presented) The system of claim 59, wherein the processor is further

configured to link a host object with a network object and a zone object.

66. (Previously Presented) The system of claim 65, wherein the zone object is linked to another zone object.

67. (Previously Presented) The system of claim 65, wherein the network object is linked to another network object.

68. (Previously Presented) The system of claim 59, wherein the processor is further configured to:

- unlink an old network object from a host object;
- delete the old network object; and
- link the host object to a new network object.

69. (Previously Presented) The system of claim 68, wherein the processor is further configured to automatically update the host object to reflect an association with the new network object.

70. (Previously Presented) The method of claim 13, wherein the operating system is derived from a full operating system that includes the at least one software component.

71. (Previously Presented) The method of claim 13, wherein the at least one software component includes one of the following: a driver or a utility software.

72. (Previously Presented) The method of claim 13, wherein the appliance excludes a hardware component that typically is included in a host computing system but that is not required to provide the network name-related functionality.

73. (Previously Presented) The method of claim 13, wherein the appliance excludes a communication port that typically is included in a host computing system but that is not required to provide network name-related functionality.

74. (Previously Presented) The method of claim 13, wherein the network name-related functionality comprises the Domain Name Service (DNS) and the IP address comprises a requested IP address associated with a host identified in a DNS request received at the appliance.
75. (Previously Presented) The method of claim 13, further including providing an interface for configuring the appliance.
76. (Previously Presented) The method of claim 13, further including providing a web interface for configuring the appliance from a client web browser.
77. (Previously Presented) The method of claim 13, wherein the appliance includes a DNS server, a configuration server, a web server, a database, and/or a GUI.
78. (Previously Presented) The method of claim 13, wherein the database comprises an object oriented database.
79. (Previously Presented) The computer program product of claim 36, wherein the operating system is derived from a full operating system that includes the at least one software component.
80. (Previously Presented) The computer program product of claim 36, wherein the at least one software component includes one of the following: a driver or a utility software.
81. (Previously Presented) The computer program product of claim 36, wherein the appliance excludes a hardware component that typically is included in a host computing system but that is not required to provide the network name-related functionality.
82. (Previously Presented) The computer program product of claim 36, wherein the appliance excludes a communication port that typically is included in a host computing system but that is not required to provide network name-related functionality.

83. (Previously Presented) The computer program product of claim 36, wherein the network name-related functionality comprises the Domain Name Service (DNS) and the IP address comprises a requested IP address associated with a host identified in a DNS request received at the appliance.
84. (Previously Presented) The computer program product of claim 36, the computer program product further comprising computer instructions for providing an interface for configuring the appliance.
85. (Previously Presented) The computer program product of claim 36, the computer program product further comprising computer instructions for providing a web interface for configuring the appliance from a client web browser.
86. (Previously Presented) The computer program product of claim 36, wherein the appliance includes a DNS server, a configuration server, a web server, a database, and/or a GUI.
87. (Previously Presented) The computer program product of claim 36, wherein the database comprises an object oriented database.
88. (Previously Presented) The system of claim 59, wherein the operating system is derived from a full operating system that includes the at least one software component.
89. (Previously Presented) The system of claim 59, wherein the at least one software component includes one of the following: a driver or a utility software.
90. (Previously Presented) The system of claim 59, wherein the appliance excludes a hardware component that typically is included in a host computing system but that is not required to provide the network name-related functionality.

91. (Previously Presented) The system of claim 59, wherein the appliance excludes a communication port that typically is included in a host computing system but that is not required to provide network name-related functionality.
92. (Previously Presented) The system of claim 59, wherein the network name-related functionality comprises the Domain Name Service (DNS) and the IP address comprises a requested IP address associated with a host identified in a DNS request received at the appliance.
93. (Previously Presented) The system of claim 59, wherein the processor is further configured to provide an interface for configuring the appliance.
94. (Previously Presented) The system of claim 59, wherein the processor is further configured to provide a web interface for configuring the appliance from a client web browser.
95. (Previously Presented) The system of claim 59, wherein the appliance includes a DNS server, a configuration server, a web server, a database, and/or a GUI.
96. (Previously Presented) The system of claim 59, wherein the database comprises an object oriented database.
97. (New) The method of claim 13, wherein:
- the first IP sub-network and the second IP sub-network are included in a logically hierarchical set of IP sub-network information; and
- the object oriented database comprises a hierarchical structure associated with the logically hierarchical set of IP sub-network information.
98. (New) The computer program product of claim 36, wherein:

the first IP sub-network and the second IP sub-network are included in a logically hierarchical set of IP sub-network information; and
the object oriented database comprises a hierarchical structure associated with the logically hierarchical set of IP sub-network information.

99. (New) The system of claim 59, wherein:

the first IP sub-network and the second IP sub-network are included in a logically hierarchical set of IP sub-network information; and
the object oriented database comprises a hierarchical structure associated with the logically hierarchical set of IP sub-network information.

100. (New) The method of claim 97, wherein the second network object is a parent of the first network object in the hierarchical structure in the object-oriented database.

101. (New) The computer program product of claim 98, wherein the second network object is a parent of the first network object in the hierarchical structure in the object-oriented database.

102. (New) The system of claim 99, wherein the second network object is a parent of the first network object in the hierarchical structure in the object-oriented database.

INTERVIEW SUMMARY UNDER 37 CFR §1.133 AND MPEP §713.04

A telephonic interview in the above-referenced case was conducted on November 6, 2006 between the Examiner and the Applicants' undersigned representative. The Office Action mailed on July 10, 2006 was discussed. Specifically, the rejections of claim 13 in light of Huitema and Baker and the proposed amendments set forth herein were discussed with the intent to place the claims in better condition for allowance or appeal.

The Applicants wish to thank the Examiner for the interview.
